1. Should EC 242 be more focused on concepts and letting AI do all of the work or should students work hard and learn the code themselves?

I believe this course should be more focused on the students working hard and learning the code themselves. I think AI can be helpful when learning different aspects of coding, but we shouldn't let it do all of the busy work. Doing the code yourself is important to understand how the code works and what chunks of code do certain tasks. It is also important to not allow AI do all of the work because it is usually not fully correct and can lead to mistakes.
