## 1. WHAT ARE YOUR THOUGHTS ON ALL CODING DONE WITH AI AND MORE DONE IN CONCEPTS ORRR LEARN THROUGH TRIAL AND ERROR TO GET ACTUAL UNDERSTANDING?

My thoughts on all coding done with AI while keeping concepts understood is **supportive** on the idea. This is based off of *past* procedures such as assembly and factory work that has been *automated* but there are still people in the world that **understand the mechanisms** behind it to troubleshoot/fix any errors the machines can run into. By this, I support the idea that we leave most known coding to be done/replicated by AI while concepts/theories/understanding is still concrete so that in the case AI gives back code that is not 100% what was asked or desired, it can be *identified by the user*. In a sense, I'm not 100% towards the idea of letting AI do all of the coding but I'm not 100% on-board with humans having to learn through harsh trial and error. If I could give a percentage of my standing, I would say to have AI do **75%** of the coding effort while **25%** is left to the user to make sure the AI is doing what is being asked and to understand what it is doing.
