

Weekly Writing - Week 1

Sam Parks

01 September, 2025

1. Learning through trial and error or with the assistance of AI?

Advantages of AI I will start this reflection by saying that I have limited real world work experience and am speaking from both an opinion and conversations with friends. The purpose of attending college and taking courses like this one is to prepare you to enter the workforce. Now with AI there is not doubt in anyone's mind that it won't take away certain jobs. I believe that while yes, it is very important that we learn coding language and how to operate functions in R studio, the assistance with generative AI would be beneficial for our entry into the workforce. We should never fully rely on AI to visualize our data, but if we use it in conjunction with general knowledge of R studio, it would make our work faster and hopefully cleaner. I recently took CMSE courses and a certain amount of AI use was tolerated and I walked away from that class more confident in my Python abilities because I wasn't banging my head about error codes and forgetting how to write certain lines. I think it is better to lean more on embracing the use of AI then falling behind on the wave.
