1. Should the class focus on learning coding to develop more in-depth skills, or Should coding be completed with Ai with a focus on course concepts?

In my opinion this course should remain as it is. I think developing an actual baseline of skills in R/Rstudio allows students to explore the program and try out questions they may have for themselves. I understand that anybody could ask ChatGPT to breakdown data and find ways to analyze it, but for students who actually care for their learning and want to develop deeper understandings of a topic, that is not the way to do it. I also understand the argument that AI is becoming increasingly more popular and can be extremely useful while coding. I think this applies more to computer science. For a course focused on statistics and statistical coding I think it is invaluable to understand the functions you are using and what they are doing to the data.
