

Weekly Writing - Week 1

Katie Scamehorn

30 August, 2025

1. What are your thoughts on all coding being done with ChatGPT and more with concepts, or do you want to learn with trial, tears, and error to understand it better?

I like using ChatGPT for assignments because it helps me see a breakdown of how the code is supposed to run and why my original attempt was incorrect. Back in high school, one of my math classes posted all homework and in-class assignments ahead of time, and I would use the notes to make sure I was on the right path. I've realized I learn best this way, so now I use ChatGPT in a similar way. I am able to ask questions in real time and I like that it typically solves coding problems different from what we learn in class. This allows me to think about what concepts we were taught in class and compare it to how ChatGPT is trying to solve it.

I have found that learning with trial, and tears, causes more frustration and causes me to not reach out for help. Not being able to use the internet feels isolating and unrealistic. My dad and brother are both computer scientists and they talk a lot about how they look things up if they cannot remember how to do something. There are too many languages, functions, and ways to solve problems with code, to just restrict it to learning how to solve it "right" way.
