All ChatGPT vs independent intentional coding

I think that it is better to build real coding skills and code independently first. Having that foundation is extremely necessary even if you were able to use ChatGPT. But, with that being said, it is obvious that AI is the future of many industries and especially that of computer science. Workers in the tech industry are already using natural language tools such as Cursor to code whole websites and apps. But, no average person could step into a tech job and be able to code as well as those engineers that use natural language programs to code. Engineers have the foundation and understanding of what needs to happen but use these tools to accelerate the process. When using ChatGPT's ability to be a context aware browser that takes into account all information on the internet even blogs or discussions on stack overflow, how much does it differ from searching the internet except in a more timely manner? This also makes me ask the question, if the dumbest person in the world truly masters the smartest tool in the world, at what capability level does that put the dumbest person? I feel that it is necessary to have a good independent foundation and ability to recognize problems and solutions in the code, but it is also necessary to be efficient in revolutionary tools that are quickly evolving to help achieve your decided outcome.
