1. Thoughts on using AI versus using “Head Bash” trial and error for coding in class.

In my opinion, there are both positives and negatives of both of using these methods in a classroom setting. The traditional trial and error method allows students to really think through the coding process, and while it may come with some frustration, it allows you to become accustomed with the coding process and some of the features of the platform. Using AI can be very convenient in terms of coding, helping complete projects much more quickly. While this can be incredibly helpful, it doesn't help you to “learn” the program as well, and may end up promoting lazy coding practices. Last year, when ChatGPT went down for a few hours, a lot of my peers freaked out about not being able to complete their assignments in time. Once again, while AI can be an incredible help, I would like to be able to code independently, generally knowing how to code well. Being able to using AI as a helpful tool, not a total replacement, is something I think is a good method.
