

Prompt 1: “What are your thoughts on all coding being done with ChatGPT and do we do more in concept, or do we want to learn through trial, tears, and error so we can work through to understand coding better?”

I think that we should work through all of the coding ourselves because I like to have hands-on experience when it comes to coding. In my past experiences with coding classes, it hasn't been too helpful when we only go over topics covered in class in concept. When I am able to apply the theories and tools learned through lectures and class, I feel like I learn the concepts better. Maybe this is due to the fact that I am almost forced to do well and learn them and a grade being on the line, but I feel like I retain the concepts better through trial by error. I think that ChatGPT is more so a learning tool that assists with filling in a gap somewhere as opposed to a device that is used to complete your work for you. I also think learning through experience trumps learning conceptually so I lean in favor of the former. To me, ChatGPT and other AI assistants only do the bare minimum when it comes to explaining topics and aren't viable teachers. I think learning as a class together and learning from peers' answers and explanations is the best way to go about learning. Now, I'm not saying I have never learned anything from ChatGPT but it wasn't fun learning that way. Robotic and slow, I just feel as if I would like to do the work myself rather than go through ChatGPT.
