

Weekly Writing - Week 1

Lexie Hinderliter

30 August, 2025

1. What are your thoughts on all coding being done with generative AI vs using trial and error to understand it better.

I think that there is still a ton of value in learning the fundamentals of code through trial and error rather than running all problems through generative AI. This summer I used a couple quick commands and scripts for my internship and since I had the time to work through it on my own, I feel like it helped me understand the processes so much better. This also made me a much quicker worker in the end because I could complete these tasks quickly without having to use AI to print out code since a lot of the time AI codes don't always work. On the other hand, I think generative AI is a great tool and has a ton of use in the data analytics field and can be extremely helpful to utilize if you are stuck instead of needing to reach out to a professor or mentor every time something isn't working. Being able to give AI a starting point with a rough outline of some code is something I find a lot of value in and seems to be a great balance between understanding the ins and outs of a coding software and also utilizing the resources that are becoming the future. Basically I think that even though these advancements are becoming more mainstream, I think there is a lot of value in finding the balance between using AI and understanding the commands and calculations you are doing on your own.
