

Weekly Writing - Week 1

Will Scherer

28 August, 2025

1. Which of the 2 seems more attractive to you, with all coding being done with CHATGPT and doing more concepts, or do you want to learn through trial and error?

Personally I would prefer having the code being done with ChatGPT or other generative AI, and focusing more on concepts instead. This is because in the real world something will always be there to help and check your work. There will never be a task I have to complete that I can't use some type of resource. This also allows us to learn more about the why things work and not just the how. When you focus too much on the how it often leads to memorization and not actually retaining any information. Rather, we let AI help us write the code, and it will let me do a better job of learning why it makes sense, why it works, and then that will allow be to do a better job of replicating it in the future.
