

Weekly Writing - Week 1

Ryan Borina

30 August, 2025

1. What are your thoughts on all coding on chatgpt or learning it the old way?

I personally have learned a lot about coding through generative AI so I'm definitely for learning with it rather than banning it entirely. Of course, learning the actual way through a textbook and from someone who knows it is important. Also, just throwing your assignment in ChatGPT makes no sense if you want to actually learn how to code the real way and understand what you're doing. I can remember one time there was a project in python I was doing when I was new to python and I was only missing one step and I kept trying to figure it out and then I put it into ChatGPT and it showed me what I was missing and I asked what that line did and why what I tried was wrong and I never made that mistake again. I didn't really want to use generative AI but it did save me time and I learned what I was missing. However, the ease of using AI is definitely a slippery slope where you can use it once to help you with one thing and then start putting it with everything and then you're just copying and pasting the whole semester so I totally understand the argument against using it.
