1. What are your thoughts on all coding being done with gpt vs learning through trials, tears and errors.

I feel like it should be a mix of both. I don't feel like you should just copy and paste the question into gpt and get the answer without using a single braincell, but I also don't see a point in completely ignoring it. I feel like trying your hardest without gpt but using it as sort of a safety net incase there's a specific thing you are not understanding is a more useful way of utilizing it. If you know it's there and there is something you absolutely do not understand I don't think it's feasible to just ignore the fact it could help you out. So I guess my answer is I feel like you should code through tears but have gpt as your safety net.
