

Weekly Writing - Week 1

Briana Hernandez

28 August, 2025

1. What are your thoughts on the fact that all coding can be done with generative AI, so we switch this course to being more based off of concepts and no coding involved. Or would you rather learn with trial and error and actually code in this class for better understanding.

In my opinion, I think that this course should remain the way that it is already structured. While it's a valid opinion that we can rely on using Chat GPT and other AI tools to do the coding and just focus on learning concepts in this class, isn't the goal of learning to be able to apply concepts learned in class to actual examples? I personally think that learning through trial and error is very important for understanding and applying information. Although, students have the freedom to ask generative ai for help, it is still very important to have real examples and exercises where we can engage with the material. This approach reinforces our learning and application while preparing us for situations outside of the classroom.
