1. What are your thoughts on all coding is done on chat gpt and we do more in concepts or do you want to learn through trial and error to learn actual coding

It is better to learn through the trial and error to learn coding– not just so that students learn actual coding techniques, but in order to help them develop stronger critical thinking skills, especially when it comes to solving problems while coding. It also means that students will gain more ability to assess the work of AI and fix its mistakes, rather than blindly accepting its work. If every time we have a problem in coding, we run to ask an AI source, then we will lose the ability to think critically about our code and find ways to make coding better. Additionally, it will make coding more homogeneous and we will lose out on chances to innovate because we take the easy way out where AI uses tried and true techniques. Using AI as our front line source of information and problem solving in anything, not just coding, will gradually decrease people's ability to think critically, leaving them more and more reliant on AI. Avoiding the use of AI allows students to create and maintain the ability to solve problems and generate new and innovative solutions.
