1. Should coding in class be done exclusively with AI?

I do not believe that our class structure should be shifted to concepts only while using AI for the actual coding. In my opinion even if a person isn't going to be using R in their future, or the future of coding in the workplace is R done entirely by AI, learning R, or any coding language, teaches really good problem solving and logic skills. Working through issues in code also teaches students things like patience and resilience when facing issues, if we shift all the problem solving to AI people will lose this important skills that can be transferred to other life situations. Also if people know how to code R themselves they will better be able to identify when AI makes mistakes, as it has proven to do in the past. This would potentially help people identify issues before they arise and cause more problems in a work situation. If the intention of education is to prepare students for their future both personally and career-wise I believe it is important that students continue to learn the coding aspect of R in order to build life skills and identify potential issues that have historically arisen with the answers generative AI gives.
