

Weekly Writing - Week 1

Daniel Lane

30 August, 2025

1. Text of the prompt or title of your writing topic goes here(replace this with the prompt)

In terms of programming AI is a tool, whether it helps with syntax or formatting it can be helpful while used for small portions of code. However, when used over a larger amount of code AI can struggle with inefficiency and bugs which can cause the speed at which the code is written to be countered by the time spent debugging. Over time this may change and AI may be able to complete programs fully on its own, so what then? I believe that when AI reaches this point the idea of coding will change from being able to write the code and have it work to how to quickly convey what one needs the AI to produce. Almost like how math classes have changed from making kids learn multiplication tables to more story problems about how to make an equation and put it in a calculator. For now coding cannot be done only with AI as it simply isn't as efficient yet as a professional programmer, but as many have been saying "today AI is the worst it will ever be." As such for now I believe that the trial and error of learning to code is still important, that way people will still know how to debug and optimize the code which AI will produce. Though, in the near future when AI is able to produce fully optimized and functional code for larger scale application and programs, then there really won't be a reason for people to deal with the trail and error of coding it would be best if they instead learned how to phrase their ideas properly in order for the AI to produce them.
