

Weekly Writing - Week 1

Charles Jeffrey

26 August, 2025

1. What are your thoughts on all coding in class being done with chat gpt with more lecture focus on concepts, or would you rather take the timing to learn “important” parts of coding through trial and error?

My Answer As professor K mentioned, I do see the value in us learning at least the basics of coding in R for the purpose of data analytics. With that said though, I think that there is an ideal balance between using generative AI to streamline some of the coding process, allowing us more time to focus on the more conceptual side of the course. I think that this would allow us as students to get a better idea of the content, which I believe will still be valuable in the workforce, especially relative to the physical coding portion of the course, considering the rapid growth of AI. As for the aforementioned “ideal balance”, I am not sure what that looks like right now, but I think that we should be using AI to streamline the process as the coding aspect of this course (in my opinion) is most likely going to be streamlined (maybe entirely decimated) by AI in the near future.
