

Weekly Writing - Week 1

Anna McAlpine

30 August, 2025

1. What are your thoughts on “all coding done with chatGPT” or learning through trial and error using actual coding?

I think that for the purposes of fully understanding all the content in this course, it would be much more valuable to students to learn through actual programming, rather than using chatGPT to do all of the coding for them. It can be helpful for outlining functions and programs, but students should know the inner workings of R in order to fully understand the outputs, and how each function works to give each result. I think that another reason why having a basic understanding of the code is important is so that students are able to recognize when chatGPT is making a mistake, or misunderstanding a prompt. There are sometimes when it might use a different function than what is necessary for the task at hand, and it is important to recognize that in research so that everything can be completed in the most effective and efficient way.
