1. Learning through trial and tears and actual coding vs learning everything through chatgpt

I think that learning coding through the application is definitely more useful than solely learning through chatgpt, but I think a lot of it is pretty complicated. There is power in having knowledge and the ability to make harder concepts more accessible to everyone, but I don't think that has to come at the expense of actual learning. I tested it out a few times for this writing prompt, when asked to create a line of code, chatgpt does explain why and how they are using R to create the line, which I feel could be useful if someone takes the time to read the "why" rather than copy and pasting. I think using chatgpt to figure out errors is a great way to use it, instead of spending hours trying to find the quotation you missed. However, on the other side of that, is it more useful to debug by yourself so you are able to know what you are doing wrong or what happened in the code that caused the error? There is a lot of benefit to actually learning the material. Once you know it, it will stay in your mind and you won't need to be dependent on AI for the rest of your time using this material. Overall, I have really mixed feelings about it. I really can see the benefit, but I also can't help but hate it a little bit.
