1. Should all coding be done using Generative AI?

While generative AI has massively changed how coding work can be done, relying on it for all coding tasks has raised various concerns. Generative AI can boost coding productivity and help with debugging code. However, generative AI lacks human creativity and deep understanding. Human developers are necessary for creating complex systems, ensuring security, and slowing skill degradation caused by over-reliance of AI. Generative AI is also limited to data it is provided, which leads to improper and biased code. Instead of completely replacing human coders with generative AI completely, they should be used as a tool to help coders by improving productivity and debugging code. Overall, generative AI should not be doing all code and humans should continue to lead the coding process while using generative AI as a helpful tool.
