1. Do I prefer chatgpt and concepts or learning the actual coding aspect?

Me Personally I think that with the way the world is heading learning the conceptd behind the code and the real world applications is more important. Being able to know what concepts to use to solve real world scenarios and being able to draw meaningful conclusions from visualizations and explaining the correlations is important. With AI only gaining more popularity its going to be less of importance of needing to know how to code 100% but yet understanding the systems needed in order to construct your desired outcome. Even as someone myself who is in the ecommerce space I use shopify. And with shopify there are various apps and preconstructed coded layouts that you dont need to know how to code persay but atleast understand how it works and understanding what code can do what and how to use it the most effecient way.
