1. Comparison between going through and learning the basics of coding, versus using ai systems for the coding and focusing more about learning statistical concepts.

I personally believe that going through coding and dealing with the struggles that may come with it, is an important part of understanding what exactly codes are doing. I can deal with the occasional or frequent frustrations when I know that practicing code will enhance my knowledge of it. While AI systems can be extremely beneficial, especially when “fixing” those frustrations that us students may run into, I think using it to simply benefit our understanding of code when stuck, versus just doing all of it, ensures that I am getting the basics down. However, with how much AI systems have already advanced, perhaps we could dive a little deeper into statistical concepts as well, as long as us students are simply using AI as a tool and not our actual work. Maybe something like this would be possibly by mixing the two options together, like having a lecture dedicated to code, and another lecture dedicated to learning more about concepts.

If you'd like to add a header, make sure you do so on a new line and use 2-4 #’s followed by a space.
