## **1. Thoughts on all coding done by generative ai and class is almost entirely about concepts vs. learning coding through trial and error?**

I think the right answer is a mix, but I would never like for a situation where the entirety of a coding class. I sympathize with the ethical criticism that all large language models are built using the work of many people while not giving any credit or compensation. Another problem I worry about is that if everyone relied completely on ai instead of learning coding, would the overall skill level of the workforce decrease and lead to less innovation? but unfortunately I think it would be naive to act as though ai doesn't exist and ban its use from learning environments considering our future bosses certainly won't ignore the potential increase in productivity from the use of ai.
