

# Weekly Writing - Week 1

Claudio Duhanxhiu

30 August, 2025

## **1. What are your thoughts on “All coding is done in chatgpt while going more in depth on the actual concepts of the lessons” or is learning the actual coding necessary in understanding in completely understanding such concepts.**

Learning how to code is a necessary tool to learn in this day and age with the up and coming of newer, more powerful computers. While learning concepts in depth is important, learning the implementations of each concept should be just as, if not more important. As mentioned previously, because computer performance and capabilities are ever evolving, there is still just as much of a need for researchers and engineers to be able to have a certain grasp on programming themselves. While chatgpt is capable of answering all of our questions on its own, it should only be used as a guide and not a do it all program as it has a long term risk of interfering with our problem solving capabilities and perseverance skills if we are not capable of thinking for ourselves. The biggest example of needing to know how to code yourself while also understanding the core concepts is chatGPT itself. Without having coding knowledge, this program/AI model wouldn't be a thing today.
