1. Should AI completely replace coding languages or should people still learn the skill?

I think that AI is incredibly useful, especially when it comes to coding. It allows you to get answers in a quick and efficient manner, saving valuable time that might otherwise be wasted banging your forehead against the keyboard in frustration. AI tools can help speed up problem-solving, generate examples, and even teach new techniques. However, I strongly believe that programmers should still take the time to understand the code being generated and how it actually works in the language they are using. If you simply copy and paste code without comprehension, you risk creating bigger problems later. When bugs inevitably pop up or when the AI misinterprets your prompt, a lack of understanding leaves you stuck and frustrated. In conclusion, while AI is an amazing tool that can increase productivity and provide support, it should always complement a solid foundation in programming skills and critical thinking.
