

Week 1 writing Assignment - Shaurya Arora

Prompt

AI has proliferated in our lives and made impacts in many different ways. With regarding to coding and this course, there are 2 broad pathways that have arisen: Using AI to completely take over debugging/code related problem solving versus “Headbanging” through a problem on your own. What is your position on this matter and the overall approach that you wish to take for this course?

Response

I believe that there is a middle pathway with AI in the context of the above prompt. I firmly believe that the problem solving and logic aspect should be left to our own competencies, with relevant “busywork” being delegated to AI. This ensures productivity increases while keeping control and ownership of the “logical” aspect of code. From a learning standpoint, this simplifies coding. Often, beginners struggle with syntax and formatting, which results in an initial reduced focus on creating sound logic and processes. If AI is used in an aforementioned manner, students can focus on “What to CODE” and not get bogged down in the “HOW”. However, syntactical command must still be built through disciplined practice without excessive dependence on AI.
