

Weekly Writing - Week 1

Juan Ayala

30 August, 2025

1. which of the 2 seems more attractive to you, all coding being done with CHATGPT and do more concepts, or do you want to learn through trial and error.

Learning through trial and error attracts my attention more because learning without mistakes isn't learning at all. Mistakes bring challenges that, when accomplished, can enhance the knowledge of the material that I'm working on. Instead of using help like ChatGPT, listening to what the instructor explains and then attempting to do it myself allows me to discover what I did wrong, lets me imagine new methods to try out, and find the answer. I accomplish all of this by doing it myself. If we use ChatGPT, I don't think it'll help me because if I find the correct answer, I'll know the answer but not the method used to find it. Overall, trial and error can be super useful for critical thinking, problem-solving, and finding ways to get out of a messy hole. It makes the individual feel more confident in themselves over solving problems particularly in R coding, I know I will have better confidence in R coding and social science analytics. Not everybody learns best through trial and error, but personally, I prefer this method.
