

Weekly Writing - Week 1

Gabriel Beaulé

28 August, 2025

1. What are your thoughts on the class being conducted using all code being done by chatgpt with much more theory emphasis or would you rather learn coding through trial and error?

In my opinion I think class should still be conducted learning code, even when done with chatgpt. This is because code allows you to visualize and handle large quantities of data, and AI is not always completely accurate. In most situations having inaccurate or mishandled data in the real world, is a liability and frankly useless. Without understanding the code or knowing what it's doing will inevitably lead to errors and an inability to fix them. Although theory is important the ability to call the data correctly is a skill and shouldn't be left behind even if code is easier to get solutions for.

Additionally, working with code in the workforce is relatively common and feeling comfortable with software is a necessity. Trial and error while coding in the real world are common and problem solving is a hard to learn skill that should be practiced. All in all, coding is still a necessity and AI still makes many mistakes, it would be detrimental to society to abandon this philosophy and it should still be taught.
